

期末補考

# 注意

1 完成後舉手 demo 即可

## ● 實驗說明:

- 1. 先實現一個 PORT C,位置是 0x0E
- 2. 實現以下指令

指令	opcode	指令說明	備註
ADDWEQCSZ	IR[13:0]=14'b11_0100_0kkk_kkkk	<ol> <li>如果F+W==port_c_out成立, 跳過2個指令。</li> <li>否則正常執行下一個指令。</li> <li>➤ F: RAM[IR[6:0]]</li> </ol>	新的
PORTCXWSZ	IR[13:0]= 14'b00_0000_0000_0011	<ol> <li>如果 PORTC == w_q 成立,跳 過後面的 3個指令。</li> <li>否則正常執行下一個指令</li> </ol>	新的

#### 實現以下硬體

 •			
硬體	Address	控制線	備註
PORTB	0x0D	load_port_b	
PORTC	0x0E	load_port_c	新的

#### HINT:

MOVWF 指令內新增一段內容:

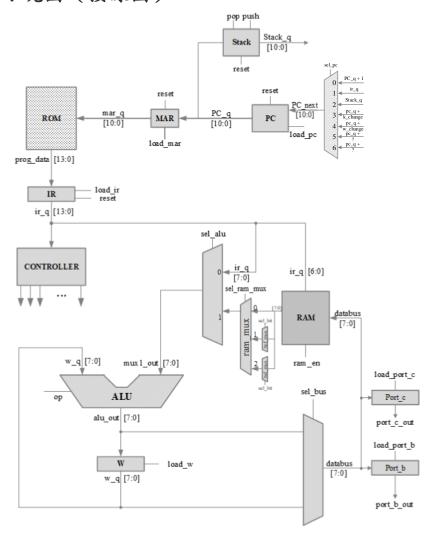

如果目標位址為 portC(0x0E), 則  $load_port_c = 1$ 

本次新增之跳躍指令的跳躍方式可參考 BRA 和 BRW,直接修改 pc\_q

sel\_pc == 5 時,為 ADDWEQCSZ

sel\_pc == 6 時,為 PORTCXWSZ

# ● 系統硬體架構方塊圖(接線圖):

## ● 組合語言

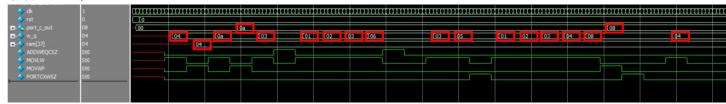

```
equ 0x25
temp
           Program start
            org
                    0x00
                                ; reset vector
                                 ; \overline{w} = 4
            movlw
                    . 4
                                 ;RAM[37] = 4
            movwf
                    temp
            movlw
                    Ax0
                                 ;W = 8'hA
                                 ; PORTC = 8 hA
            movwf
                    PORTC
            movlw
                    .3
                                 ; W = 3
                                 ;F+W=7,PORTC=8'hA 不跳躍
            addweqcsz temp
            movlw
                                 ; W = 1
            movlw
                                 ;W = 2
            movlw
                    .3
                                 ;W = 3
            movlw
                    .6
                                ; W = 6
            addweqcsz temp
                                 ;F+W=8'hA,PORTC=8'hA 跳躍
                                ;跳過
            movlw
            movlw
                                ;跳過
            movlw
                    .3
                                ; W = 3
                                 ;W = 5
            movlw
                    .5
                                 ;PORTC = 8'hA,W = 5 不跳躍
            portcxwsz
                                 ; W = 1
            movlw
                    .1
                                 ;W = 2
            movlw
                    .2
                    .3
                                 ;W = 3
            movlw
            movlw
                    . 4
                                 ; W = 4
                                 ;W = 8
                    . 8
            movlw
                    PORTC
                                ; PORTC = 8
            movwf
                                 ;PORTC = 8,W = 8 跳躍
            portcxwsz
                                ;跳過
            movlw
                    .1
                                ;跳過
            movlw
                    .2
            movlw
                    .3
                                ;跳過
            movlw
                    . 4
                                ; W = 4
            goto
            end
```

# ● Program\_Rom.v 程式如下

```
11'h0 : data = 14'h3004;
                                //MOVLW W<=4
11'h1 : data = 14'h00A5;
                               //MOVWF ram[37]<=4
11'h2 : data = 14'h300a;
                               //MOVLW W<=a
